

Prevail™ Organic Acid HPLC Columns

Prevail™ Organic Acid Columns separate a wide range of organic acids with an unsurpassed combination of resolution, speed, sensitivity, and simplicity. Under the right set of conditions and an appropriate detector, Prevail™ Organic Acid Columns can be used to analyze not only short chain organic acids but also aromatic acids, long chain fatty acids, alcohols, and even carbohydrates. Use the retention time values in **Table 1** to aid in method development and mobile phase selection. Need high throughput or fast analysis? Run times can be dramatically decreased using the Rocket™ Column format or using a longer 250 x 4.6mm column to increase resolution.

Table 1 - Retention Times (in min) of Common Analytes on Prevail Organic Acid 150 x 4.6mm, 5µm, 1.0mL/min, Using Various Mobile Phases

CAUTION Users should be aware of the hazards associated with their mobile phase. Always use appropriate personal protective equipment such as safety goggles or glasses, Lab coat and gloves when the column is in operation or when handling mobile phase.

WARNING Columns operate at high pressures. To avoid leaks or pressure related failures, please ensure all fittings and connections are tight and secure before operating the column. Refer to the QC chromatogram for maximum operating pressures.
