Big Rock Energy AB apply for exploration permits for oil and gas in Sweden

Big Rock Energy AB has submitted an application for an exploration permit for 559 hectares' oil & gas north of Falköping to Bergsstaten.

The company has in SGU water-well archives found three wells containing gas. One of these wells has according to SGU pumped gas for 26 hours.

The geology in this area are similar to Falköping # 1 directly south of the applied exploration permit with ordovician limestone and shale that may include commercial quantities of gas and possibly oil. Reports from south of this permit indicates high levels of organic matter and up to 10% oil (oil-cut).

CEO Carl-Adam Andersson comment:

"When the applied area is granted by Bergsstaten Big Rock Energy AB receives exploration permits containing all water wells containing gas that the company has found. This application also strengthens the Big Rock Energy's position in the oil and gas exploration in Sweden. "

Big Rock Energy AB is a progressive energy company that is constantly looking for new projects both nationally and internationally.
